### 1.6. Transmit Power Back-off

Note: Applies to 2.4GHz low band only.

When  $2.7\text{ V} < V_{IN} < 3.6\text{ V}$ , the output power shall be backed off by 0.8 dB per 300 mV drop of  $V_{IN}$  below 3.6 V to guarantee meeting spectral mask, EVM, harmonic levels, spurious emissions and regulatory requirements in general.

When  $2.3\text{ V} < V_{IN} < 2.7\text{ V}$ , an additional back-off of the output power is needed to guarantee meeting spectral mask, EVM, harmonic levels, spurious emissions and regulatory requirements in general.

When the load is not  $50\Omega$ , the output power is backed off to guarantee meeting spectral mask, EVM, harmonic levels, spurious emissions and regulatory requirements in general. The device is able to withstand a VSWR of up to 12:1 without any damage.

When the temperature increases from  $+25^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ , the output power shall be backed off by 0.25 dB per  $10^{\circ}\text{C}$  increase to guarantee meeting spectral mask, EVM, harmonic levels, spurious emissions and regulatory requirements in general.

### 1.8. Layout Drawing

Size: 12 mm x 12 mm x 2.7 mm

## 2. Hardware Block Diagram

### 3. Hardware Design

#### 3.1. PCB layout guide

- All unused pins should be left floating; do not ground.
- All GND pins must be well grounded.
- Traces should not be routed underneath the module.
- Use short, 50 ohm impedance, RF traces. Routing should be on the top layer.
- A diplexer may be used to combine 2.4GHz and 5GHz RF signals.
- Keep the clock and power signals far away from RF signals.
- Use a 22uF capacitor near Vin pin 9.
- SDIO signal traces should be equal length and their offset should be under  $\pm 50$ mil according to the clock of SDIO.
- All power supply lines should meet their power requirements.
- LPO traces should keep clear from other low frequency traces, such as IIC.

#### 3.2. Module Reflow Installation

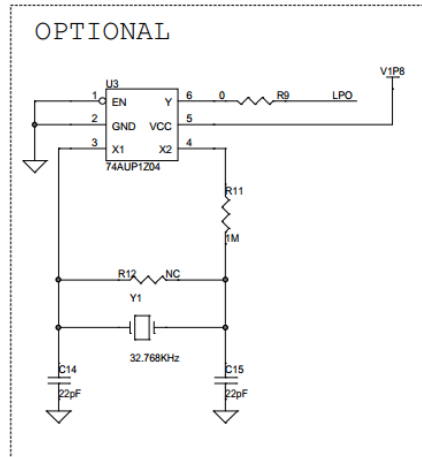

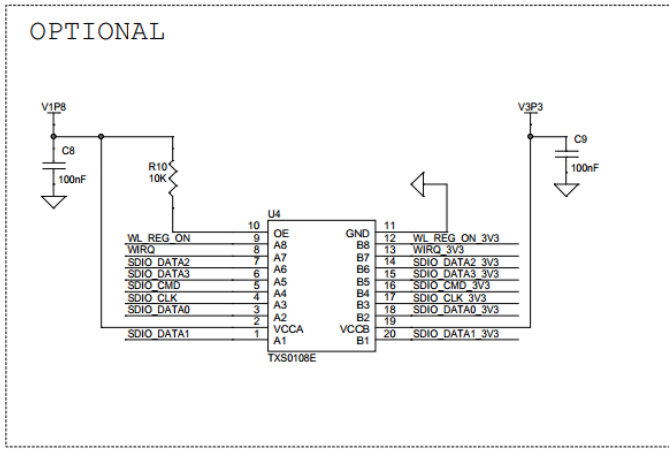

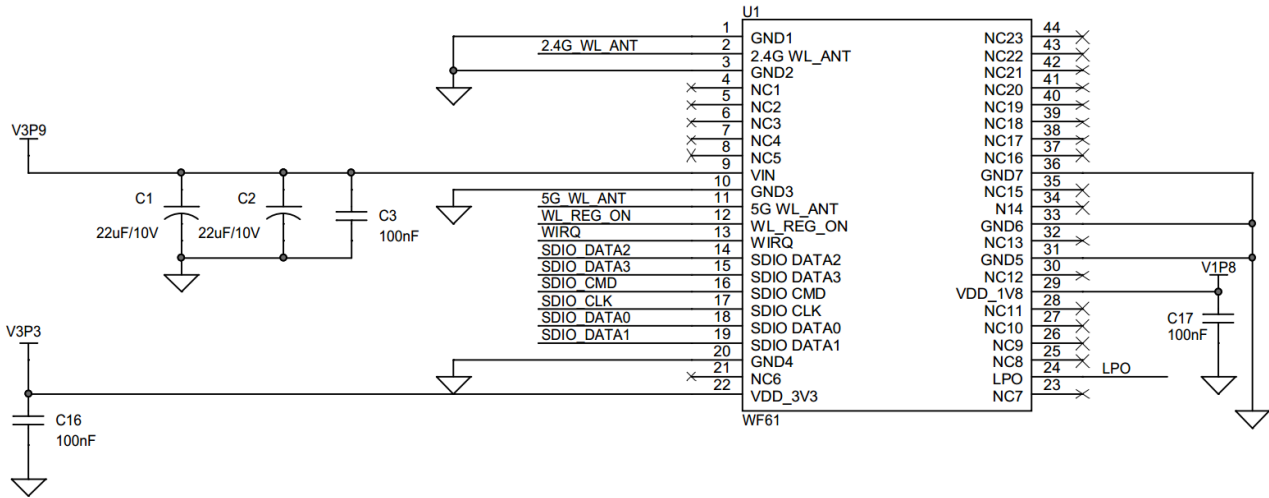

The WF61 is a surface mount WiFi module supplied on a 44 pin, 6-layer PCB. The final assembly recommended reflow profiles are:

For RoHS/Pb-free applications, Sn96.5/Ag3.0/Cu0.5 solder is recommended.

- Maximum peak temperature of 230° - 240°C (below 250°C).
- Maximum rise and fall slope after liquidous of  $< 2^{\circ}\text{C}/\text{second}$ .
- Maximum rise and fall slope after liquidous of  $< 3^{\circ}\text{C}/\text{second}$ .
- Maximum time at liquidous of 40 – 80 seconds.

### 4. Reference Design Example

The follow circuits are examples of typical Linux based platform connections to the WF61A module.

The follow circuits are examples of typical Linux based platform connections to the WF61L module.

## 5. Startup behavior

### 5.1. WL\_REG\_ON

A valid reset shall be obtained by maintaining WL\_REG\_ON active (low) for at least two cycles of LPO after VIN is stable within its operating range. There is no constraint on the activation of the other supplies during this process.

### 5.2. SDIO and SPI interface

SDIO DATA2 is the selection pin; the state of this pin is monitored on the rising edge of RESET.

- LOW selects SPI
- HIGH selects SDIO
